SafePassage Domain Research: IPV Emergency Disbursement Landscape

Research compiled for the MLH Midnight Hackathon, May 15–17, 2026. Builder: Stephen Sookra.

1. NNEDV Federation Map

NNEDV Structure

The National Network to End Domestic Violence (NNEDV) is a 501(c)(3) founded in 1990, operating as a membership and advocacy organization comprising the 56 state and territorial domestic violence coalitions and representing over 2,000 member organizations nationwide. It is the primary national voice for domestic violence policy at the federal level and led efforts to pass the Violence Against Women Act of 1994. Its membership includes state coalitions that in turn represent local shelters and advocacy programs — making it a two-tier network: NNEDV → state coalitions → local programs.[1][2]

Safety Net Project

NNEDV's **Safety Net Project** is the operational unit directly relevant to SafePassage. Founded in 2002, it focuses exclusively on "the intersection of technology and domestic and sexual violence" and works to address how technology impacts the safety, privacy, accessibility, and civil rights of victims. As of 2025, Safety Net has trained more than 96,000 advocates, law enforcement officers, legal service providers, prosecutors, and community agency members across the United States and internationally. Its current work areas include:[^3]

- Working with tech companies to audit product safety for survivors
- Educating advocates and the public on strategic technology use
- Training law enforcement and justice systems on technology-facilitated abuse
- Advocating for policy protections for survivors' digital civil rights[^3]

Safety Net publishes comprehensive toolkits on TechSafety.org, hosts an annual virtual Tech Summit (the 2025 Summit ran July 15–17), and maintains the **App Safety Center** for survivor-oriented tech assessments. Gen Digital (Norton/LifeLock) has provided multi-year grants of $100,000/year specifically to support Safety Net's work on financial abuse and tech safety. This corporate partnership track is the most relevant entry path for a fintech/blockchain product like SafePassage.[4][5] [^6]

NNEDV's Safety Net explicitly operates at the technology-safety-finance intersection, making it the single most important validator for SafePassage's core design claims.[^7]

Georgia Coalition Against Domestic Violence (GCADV)

GCADV is the federally recognized state domestic violence coalition for Georgia, headquartered in Decatur, GA, with a staff of 15. It represents over 53 domestic violence organizations and programs statewide and traces its roots to 1980 as the Georgia Network Against Domestic Violence.[8][9]

GCADV's current program areas include:[^10]

- Training and technical assistance for DV programs
- Public policy and advocacy
- Statewide outreach and community engagement
- BRIDGES Deaf Advocacy Program (Metro Atlanta and Rome)
- Justice for Incarcerated Survivors Project

Of particular relevance to SafePassage is GCADV's **Economic Justice Program**, which includes a HUD-funded Transitional Housing Program in partnership with PADV (Gwinnett County), Project Safe (Jackson County), and Circle of Hope (Habersham County). GCADV also operates the **Don't Knock the Hustle** mini-grant program for entrepreneurial survivors and provides financial empowerment training via the Allstate Foundation's *Moving Ahead* curriculum.[11][12]

GCADV Public Policy: Address Confidentiality

A major legislative win directly relevant to SafePassage: GCADV helped pass **SB 324 in 2024**, which created Georgia's Victim Centered Address Confidentiality Program within the Office of the Secretary of State. This program provides survivors who have relocated with a substitute address to protect their confidential residential address — analogous at the physical-world level to the on-chain anonymity SafePassage creates digitally. The program's effective date is July 1, 2026. This creates an immediate real-world policy hook for SafePassage's pitch.[13][14][^15]

Partnership Pathways for Tech Products

NNEDV and GCADV do not publish an open API for technology partner onboarding. The pathway for a product like SafePassage runs through:

1. Safety Net's **tech company consultation program** (contact via nnedv.org/content/technology-safety)
2. State coalition technology safety advisories (GCADV's training division: achampion@gcadv.org)[^16]
3. Annual Tech Summit participation ($150 registration; recordings available post-event)[^5]

No formal "NNEDV Certified Tech Partner" credential was identified in current published materials.

Implication for SafePassage build: NNEDV/Safety Net is your anchor institutional validator. SafePassage should be positioned as infrastructure for Safety Net's existing framework —

not a consumer product, but a backend protocol that shelters integrated with GCADV could operate. Reference TechSafety.org guidelines explicitly in your demo and pitch materials.

2. Atlanta-Specific IPV Infrastructure

Partnership Against Domestic Violence (PADV)

PADV, founded in 1975, is metro Atlanta's primary DV shelter operator and the most directly relevant institutional partner for SafePassage. Key facts:[^17]

- **Beds:** 96 emergency beds[^17]
- **Counties served:** Fulton and Gwinnett[^17]
- **Crisis hotline:** 404-873-1766 (24/7)[^17]
- **Annual reach:** Transforms the lives of approximately 18,000 women, children, and teens per year[^18]
- **Services:** Emergency shelter, crisis intervention, lethality assessment, emergency cell phones, legal lay assistance, court accompaniment, financial empowerment training, transitional housing[^17]
- **Maximum shelter stay:** 90 days[^17]
- **GCADV member:** Yes[^17]

PADV explicitly provides **financial empowerment training** and has a published focus on survivors escaping financial abuse. As of January 2026, PADV's primary focus when survivors seek financial support is **rental assistance** — directly mapping to one of SafePassage's stated service categories (housing).[19][20]

Other Active Fulton/DeKalb Area Shelters

The Georgia Criminal Justice Coordinating Council's certified DV agency list includes the **Center for Pan Asian Community Services (CPACS)**, which serves Gwinnett, Fulton, DeKalb, and Cobb counties (770-936-0969 for Fulton). This is significant for SafePassage as it covers underrepresented survivor communities in metro Atlanta.[^21]

Atlanta Legal Aid Society

Atlanta Legal Aid serves the five-county metro Atlanta area (Clayton, Cobb, DeKalb, Fulton, Gwinnett) and **assists over 1,000 victims of domestic violence annually** in securing legal protection. Services are free for low-income individuals and include:[22][23]

- Family law, divorce, custody, and child support
- Domestic violence protection orders
- Housing, healthcare, and public benefits[^24]

Legal aid retainer is one of SafePassage's stated service categories. Atlanta Legal Aid's Fulton County headquarters is at 54 Ellis St. NE Atlanta, GA 30303, reached at 404-524-5811. This is a

verified, mapped institutional address suitable for use as a demo "verified service endpoint." [^23]

The **Atlanta Volunteer Lawyers Foundation (AVLF)** also provides free legal assistance specifically for Temporary Protective Orders (TPOs) and DV-related legal needs.[^25]

Georgia State Emergency Funding Mechanisms

TANF / Family Violence Option (FVO): Georgia administers TANF through county offices of the Division of Family and Children Services (DFCS). A key mechanism is the **TANF diversion program**, which provides a non-recurrent lump-sum payment (rather than ongoing cash assistance) to help families avoid entering TANF — this is the closest existing state mechanism to a one-time emergency disbursement. Georgia has adopted the **Family Violence Option (FVO)**, requiring TANF caseworkers to screen clients for domestic violence and grant waivers from work requirements for those in DV situations.[26][27] [^28]

Current disbursement rails for TANF: Georgia issues benefits via the **Georgia Gateway card** (an EBT-style prepaid debit card administered through DFCS). There is no direct cash-to-survivor transfer outside of this card system or in-person voucher distribution.

Georgia SAVES Program: The state's **Safe Access for Victims' Economic Security (SAVES)** program, run through the Division of Child Support Services (DCSS), provides private one-on-one assistance to DV survivors navigating child support proceedings. While not a direct disbursement mechanism, SAVES represents the state's recognition that financial safety for DV survivors requires anonymized access to state systems — directly parallel to SafePassage's core thesis.[^29]

VOCA Grants / CJCC: Senator Ossoff's office delivered $3 million to Georgia's Criminal Justice Coordinating Council in 2023 to fund certified DV shelter programs statewide. GCADV also administers the Civil Legal Assistance to Families Victimized by Domestic Violence Project, providing grants under Georgia Rules and Regulations Chapter 297-1, covering approximately 6,000 families annually.[30][31]

Hospital-Based Programs

Grady Health System (Atlanta's only Level 1 Trauma Center, serving primarily Fulton and DeKalb County residents) operates:[^32]

- **Grady SAFE (Survivor Advocacy and Forensic Evaluation Center):** Hospital-based sexual assault program; crisis line 404-616-4861[^33]
- **Grady Nia Project:** Conducted through Emory University's Department of Psychiatry and Behavioral Sciences, targeting low-income Black women experiencing DV who have attempted suicide; provides group therapy and psychoeducational programming[^34]
- **IVYY Project (Interrupting Violence with Youth and Young Adults):** Launched January 2023 at Grady; serves violence-affected patients ages 14–34 with bedside and outpatient support; as of March 2024, less than 2% of patients treated through IVYY returned with a gunshot wound vs. a national reinjury rate of 30–40%[35][36]

Emory University School of Medicine and Morehouse School of Medicine both contract services at Grady, making it Atlanta's primary hospital-based social intervention infrastructure.[^32]

Implication for SafePassage build: PADV (Fulton/Gwinnett) and Atlanta Legal Aid (five-county metro) are your two anchor "verified service providers" for the demo. Their institutional addresses are public and can be used as destination addresses in the demo flow without exposing survivor identity. Georgia's SB 324 address confidentiality program provides a directly analogous precedent for the shelter-code issuance model.

3. Existing Emergency Disbursement Mechanisms

Allstate Foundation Purple Purse

The Allstate Foundation has invested more than $55 million through its **Purple Purse campaign** since its inception, focused on financial empowerment for DV survivors. The program architecture includes:[^37]

- **Purple Purse Moving Ahead Grant Program:** Awards funding to state DV coalitions (applications due in August; funding distributed via coalition→local program pipeline)[^38]
- **Purple Purse Challenge:** Annual October (Domestic Violence Awareness Month) competition where 250+ nonprofits compete for a total of ~$700,000 in grants[^37]
- **Moving Ahead Through Financial Management curriculum:** Free financial literacy training provided to DV programs; has trained more than 8,600 DV service providers[^39]

The Allstate Foundation has publicly confirmed that 99% of DV cases involve financial abuse — corroborating SafePassage's core statistic. Current program status: active as of July 2025 annual challenge cycle.[^37]

FreeFrom

FreeFrom (freefrom.org), founded by Sonya Passi in 2016, is a national survivor-led organization focused exclusively on survivor financial safety. Current programs include:[40][41]

- **Safety Fund:** Flexible, no-strings-attached emergency cash assistance (not open year-round; interest form required)
- **Savings Matching Program:** Matches survivor savings dollar-for-dollar up to $55/month (previously $40/month), building up to $1,440 in emergency savings over 12 months[42][40]
- **My Next Steps:** 12-week peer financial coaching program; first cohort ran in 2024 with 60+ survivors[^43]
- **Gifted Community Market:** Social enterprise where survivors sell products to generate income[^41]

FreeFrom's Savings Matching Program is explicitly **trust-based** — participants self-report savings via a survey; no bank account or social security number required. This design philosophy (no required ID, no transaction surveillance) is the closest existing analog to SafePassage's threat model. FreeFrom has influenced legislation in 21 states on economic justice for survivors. FreeFrom held its second **Survivor Wealth Summit** in Los Angeles August 2025, convening 600 survivors, service providers, and funders.[44][42] [^41]

FinAbility (Portland, OR), a survivor-led nonprofit founded by Stacy Sawin, targets 500,000 survivors annually by 2030 with trauma-informed, low-barrier financial tools — a direct market parallel to SafePassage's addressable user base.[^45]

How Money Currently Routes (State TANF Emergency Disbursements)

In Georgia, emergency financial assistance for DV survivors flows through multiple overlapping channels:

1. **TANF diversion (lump-sum):** Issued via Georgia Gateway EBT card, usable at ATMs and retailers; not crypto, not cash-in-hand[27][28]
2. **Shelter-issued emergency funds:** Local programs like PADV issue **rental assistance as their primary focus** for financial support seekers — disbursed as checks or direct payments to landlords, not to survivor accounts[^20]
3. **Legal aid fee waivers:** Atlanta Legal Aid files TPO motions at no cost; no direct cash disbursement
4. **Purple Purse grants:** Flow through state coalition→local program pipeline, reaching survivors as services rather than direct transfers
5. **FreeFrom safety fund:** Direct unrestricted cash disbursed to survivor (method not publicly specified; no bank account required)[40][42]

Privacy Failures of Current Rails

This is the most critical domain evidence for SafePassage's structural argument:

Venmo: Default public setting for all transactions until recently, despite an 8-year documented record of "alarming" privacy failures. A landmark academic study of 389 million Venmo transactions over 8 years found that 10.5% (41 million notes) leaked sensitive information — health conditions, political orientation, drug/alcohol consumption — involving 8.5 million unique users. Crucially: "the privacy of a user who transacts with a group on Venmo can be reduced or eliminated through the actions of other users" — meaning a survivor cannot protect themselves even if they change their own settings.[46][47]

Cash App / PayPal: An audit of 13 mobile banking apps and 17 peer-to-peer payment apps (USENIX Security 2023) found that all tested apps are "generally ill-equipped to deal with user-interface bound (UI-bound) adversaries, permitting unauthorized access to logins, surreptitious surveillance, and harassing messages and system prompts". The adversary model studied — someone with physical access to the device who interacts via standard UI — is **exactly the IPV abuser threat model.**[48][49]

CFPB Warning: Funds stored in Venmo, Cash App, and PayPal do not carry standard FDIC deposit insurance, posing additional financial risk to survivors using these as emergency savings vehicles.[50][51]

Implication for SafePassage build: The USENIX 2023 audit is your single most powerful citation for the structural failure of existing rails. It proves empirically — not theoretically — that mobile fintech is unsafe for IPV survivors. SafePassage's design directly addresses the UI-bound adversary threat model that existing apps fail to address.[^48]

4. The Tech Abuse Threat Model

Cornell Tech Clinic to End Tech Abuse (CETA)

Diana Freed, formerly a PhD candidate at Cornell Tech's Information Science program, is the primary academic researcher whose work grounds this threat model. Her current position is Assistant Professor in Computer Science at Brown University and Fellow at Harvard's Berkman Klein Center. CETA (ipvtechresearch.org) is an interdisciplinary research group that operates a free clinic for IPV survivors in New York City where trained technologists conduct individualized tech safety assessments.[52][53]

Key findings from Freed and CETA's research:

- In a preliminary study with 44 DV survivors, roughly **half were at risk of compromised accounts, potential spyware, and misuse of cellphone family sharing plans** to monitor victims[^54]
- Abusers rarely need sophisticated technical skills: "The biggest danger lies not in the device itself, but in how it is handled" — most surveillance uses standard consumer apps[^55]

What Abusers Actually Monitor

The IPV tech abuse threat model identified through CETA, NNEDV Safety Net, and stalkerware research includes:[56][57] [58][55]

- **Stalkerware / spyware** (e.g., mSpy): Installed without consent; monitors location, calls, texts, browser history, photos, and app activity. No icon shown to victim. Kaspersky identified over 31,000 stalkerware cases in 2023, a 6% increase year-over-year[57][58]
- **Family sharing plans** (Apple Family, Google Family Link): Legitimately purchased as child safety tools, weaponized for partner surveillance[^57]
- **Banking apps and transaction histories:** A 2023 study of 158 IPV survivors found four categories of financial tech abuse: exploiting, monitoring, restricting, and sabotaging a survivor's financial accounts[^59]
- **Smart home devices:** Thermostats, security cameras, voice assistants used as covert surveillance infrastructure[^60]

- **Find My / GPS apps / AirTags:** Location tracking through both consumer apps and covert hardware[^58]
- **Screen time reports and app usage logs:** Shared account features that expose device activity[^54]
- **Browser history:** Key surveillance vector; NNEDV explicitly advises survivors to use incognito mode and clear history[^61]

Why Crypto Wallets Are Not Safe Defaults for Survivors

Standard blockchain wallets fail the IPV threat model on multiple dimensions:

1. **On-chain transaction transparency:** On public chains (Ethereum, Bitcoin), all transactions are visible on-chain — an abuser monitoring a wallet address can observe every transaction, timestamp, counterparty address, and amount
2. **Wallet app visibility:** Standard crypto wallet apps installed on a shared or monitored device expose the same UI-bound adversary risks as banking apps[^48]
3. **Address persistence:** A reused wallet address is permanently linkable across transactions; even pseudonymity fails when the abuser knows the address
4. **Key disclosure risk:** Abusers who force password/PIN disclosure can access any locally-stored wallet key[^55]
5. **Recovery seed vulnerability:** Recovery seeds stored on shared devices or cloud accounts (common among non-technical users) expose all funds[^62]

Midnight's **DApp-specific public keys** directly address points 3 and 5 by generating unlinkable keys per application, and the witness-state architecture addresses points 1 and 2 by ensuring no personal data touches the public ledger.

Implication for SafePassage build: The NNEDV Tech Safety App was discontinued in 2025, creating a visible gap in survivor-facing tech tools. Do NOT store any device-side data in browser storage or local state. The device is compromised. The only safe surface is the ZK proof output that reveals nothing about the survivor even if screen-captured by the abuser.[^63]

5. Shelter-Code Precedent

Do Shelters Currently Issue Access Codes?

No published evidence was found of shelters currently issuing cryptographic or blockchain-compatible verification tokens. Existing "verification" mechanisms in the shelter ecosystem are paper-based and analog:

- **New York State LDSS-3668 "Shelter Verification" form:** A paper form completed by landlords or property owners to verify residency and shelter expenses for TANF purposes — designed for benefits eligibility, not payment authorization[^64]

- **HMIS (Homeless Management Information System):** HUD's federal standard for homeless services data tracking. HMIS stores client data, service records, and program enrollment — but its data is not used to authorize payments and has known survivor safety concerns (DV providers have special confidentiality requirements under HMIS) [^65]

The closest analog to a "shelter-issued access code" in current practice is the **case management intake number** assigned to each shelter client — a numeric identifier used by advocates for case coordination. This is currently paper/software-based (not cryptographically secure) and is NOT used as a payment authorization token.

Hotel Anonymous-Booking Programs

NNEDV has published partnerships with corporate entities, but no evidence was found of current Marriott, IHG, or hotel chain anonymous-booking programs specifically for DV survivors in active operation as of 2026. PADV and other Atlanta shelters route survivors to transitional housing rather than hotel placements. This remains a gap and not a precedent for shelter-code systems.

Georgia Address Confidentiality Program (SB 324)

This is the strongest real-world precedent for SafePassage's shelter-code model. Georgia's new **Victim Centered Address Confidentiality Program**, created by SB 324 (signed 2024) and effective July 1, 2026, operates as follows:[15][13]

- Administered by the **Georgia Secretary of State's office**
- Survivors apply (with or without an advocate) and receive a **substitute/designated address** in place of their confidential residential address
- The Secretary of State is designated as the legal agent for receiving mail and service of process
- The program shields the participant's actual address from public records, court filings, voter rolls, and employer records

This program is **structurally parallel to SafePassage's shelter-code model**: a trusted institutional intermediary (Secretary of State / shelter) issues a verified credential that substitutes for the survivor's real identity in public-facing systems. GCADV spearheaded this legislation.[^14]

What a Real Shelter ↔ Payment-System Handshake Looks Like Today

Current practice for emergency financial disbursement through DV shelters:

1. Survivor arrives at or contacts PADV or GCADV member shelter
2. Intake advocate conducts safety and lethality assessment
3. Advocate identifies financial need and eligible programs (TANF, Purple Purse funds, emergency assistance fund)

4. Disbursement occurs as: (a) check written by shelter directly to landlord/utility/pharmacy; (b) TANF EBT card issued by DFCS; (c) case manager accompanies survivor to service provider; or (d) FreeFrom-style direct cash transfer (digital or physical)
5. All records are maintained in HMIS, which has DV-specific confidentiality protections under federal law

The critical observation: **disbursement currently never goes directly to the survivor's financial account** when financial abuse is active. It routes through service providers (landlords, utilities, pharmacies) or institutional intermediaries. SafePassage's mechanism — paying directly to verified service addresses rather than survivor wallets — is not an innovation over current practice; it is a direct digital replica of the existing analog workflow. This is a strong framing point for legitimacy.

Implication for SafePassage build: SafePassage's "never pay the survivor's wallet, always pay the service address" design is not a technical limitation — it is the exact current best practice in shelter financial advocacy, now enforceable by code rather than by caseworker judgment. Frame the ZK commitment scheme as the cryptographic enforcement of what advocates already do manually.

6. Safety Guardrails for the Build

NNEDV Safety Net / TechSafety.org Concrete Dos and Don'ts

NNEDV Safety Net guidelines for tech tools serving survivors:[6][66] [67][61]

DO:

- Enable immediate, one-click full exit from any survivor-facing screen (the "quick exit" button is a standard UX requirement)[^61]
- Ensure any history of the app/tool is cleared on exit (browser, session, logs)
- Default to the **most private setting** — survivors should not have to actively enable privacy
- Design for surveillance as the default threat model, not as an edge case
- Ensure the tool functions without creating any visible footprint on the device
- Use survivor's preferred safe contact method only after confirming safety — "What is safe or private for a survivor can change"[^68]
- Provide resources to local hotlines within the tool (National DV Hotline: 1-800-799-7233)[^69]

DO NOT:

- Log or store location data at any point in the application flow
- Create any browser history, cookie, or cache that could reveal use of the tool
- Send push notifications or SMS confirmations to the survivor's device (visible in notification center)
- Require selfie, photo, or biometric verification (camera usage may be monitored)

- Store any survivor-identifying information in app state or local storage
- Create transaction confirmation pages that reveal the service category or amount (screen could be viewed by abuser)
- Design features requiring survivors to identify themselves or create accounts
- Build in user-side logging or activity history

Specific IPV Advocate Feedback: What Makes Survivor Tech Dangerous

From CETA and Safety Net research:[52][60] [^54]

- Tools that **require a new app download** create a visible installation record on shared devices
- Tools that **send email confirmations** to a shared or monitored email account expose survivor activity
- Tools that **display transaction status screens** may be viewed by an abuser shoulder-surfing or viewing screen captures via stalkerware
- Any **on-chain address** associated with survivor activity, even pseudonymous, can be monitored by an abuser who learns the address (as with monitoring a Venmo username)
- Safety planning for digital tools must account for the fact that **removing stalkerware can escalate danger** — if an abuser realizes monitoring has been disrupted, they may physically escalate[66][56]

NNEDV Tech Safety Summit 2025: Emerging Guidance

At the 2025 Safety Net Tech Summit, NNEDV's Assistant VP Erica Olsen stated the guiding principle for conversations with tech companies: "minimize opportunities for abuse, while also maximizing support for any survivor or victim who is abused on the platform". Safety Net's 2025 year-in-review explicitly noted that in a "rapidly shifting landscape, our focus has remained steady: helping survivors, advocates, policymakers, and industry professionals respond to change in ways that center survivor safety, privacy, autonomy, and dignity".[70][71]

Implication for SafePassage build: The most dangerous single moment in the SafePassage flow is the **demo UI**. The on-screen confirmation that a disbursement occurred must show ZERO survivor-linkable information. Even in demo mode, the judge's screen must prove that nothing attributable to "Tanya Williams" appears. Build the quick-exit button. Ensure the demo terminal/browser shows zero session history. This is not performance — it is the product requirement.

TOP 5 RISKS / BLIND SPOTS Stephen Must Know Before Hour 0

Risk 1: The "Verification Paradox" — Shelter-Code Issuance Requires an Offline Ceremony

SafePassage's mechanism requires a shelter to issue a code (commitment hash) to the survivor before she enters it as a witness input. In a 48-hour hackathon, this is **mocked**. But in production, this "shelter issuance ceremony" is the highest-risk moment in the entire system: it requires the survivor to have shelter access, which implies she is already partially out of the abusive environment. Judges familiar with DV advocacy will ask: "How does a survivor who hasn't yet contacted a shelter get a code?" This is not a dealbreaker — it's a valid constraint (the protocol serves survivors who have initiated contact, not those who haven't), but Stephen must have a crisp answer ready.

Risk 2: Device Monitoring Nullifies On-Chain Privacy if the App Is Visible

If stalkerware is running on Tanya's phone, it can capture screenshots of the SafePassage UI *before* ZK proof generation — including the service category she selected and the amount. Midnight's witness state is unobservable from the chain, but it is observable on the device's screen. The threat model for SafePassage is therefore a **two-layer problem**: (a) on-chain privacy (Midnight solves this) and (b) on-device UI privacy (SafePassage's UX must solve this). NNEDV's guidelines confirm this: the device is a more active surveillance surface than the chain. Build for maximum UI ephemerality — no persistent state, no screen content after submission, an immediate "clean exit" that returns the screen to a neutral state.

Risk 3: "Verified Service Address" Oracle Trust — Who Maintains the Whitelist?

SafePassage's mechanism routes funds to "verified service addresses" (Lyft Health, RentRedi, legal aid retainers). In the demo, these are hardcoded or mocked. In production, the question becomes: who curates and maintains the on-chain whitelist of verified service endpoints? If PADV's payment address changes (organization moves, bank changes), the contract becomes outdated. If the whitelist is permissioned by a single admin key, the protocol is not trustless. This is an oracle governance problem that judges from the DeFi track will identify immediately. Prepare a brief answer: "The verified-address Set is governed by the shelter coalition (GCADV in Georgia), with a multi-sig threshold update mechanism — outside MVP scope but architecturally planned."

Risk 4: TANF and Federal Benefits Interaction — SafePassage Payouts May Affect Means-Testing

If a survivor receives an emergency disbursement through SafePassage that is routed to a landlord or pharmacy, the question arises whether that payment constitutes "income" for purposes of TANF, Medicaid, or other means-tested benefits. Current TANF rules require cooperation with child support enforcement unless DV good cause is claimed. A direct payment to a service provider on behalf of a survivor may or may not be reportable depending on state and federal rules. Stephen does not need to solve this for the hackathon, but should acknowledge it as a legal/regulatory consideration in the pitch to demonstrate awareness of the production environment.[72][26]

Risk 5: Advocate Buy-In Is the Real Distribution Gate — Not the Tech

Every piece of DV advocacy research, NNEDV guidance, and FreeFrom/FinAbility feedback converges on one truth: survivors access financial tools **through trusted advocates**, not through direct consumer channels. A survivor with 11 minutes alone in the bathroom daily is not self-onboarding onto a blockchain protocol — she is receiving a code from an advocate who has completed the ceremony on her behalf. This means SafePassage's go-to-market is 100% B2B (shelter networks, GCADV member programs) and 0% direct-to-consumer. Judges evaluating Build Club potential will want to see this clearly articulated. The survivor is the beneficiary; the shelter advocate is the customer.[68][45]
